The Explanation of Population Flows Network in the Firouzkooch Township

Date received: 26 January 2012

Date accepted: 22 November 2012

Abstract

Conformity of human with natural has led to the formation of network of population movements in valleys and mountain areas of the Firouzkooch Township. Capacity and elasticity of population retention in the study area is a function of ecological, economic and social. Key questions are factors and outcomes affecting in network of population flows in the Firouzkooch Township. The methodology is exploratory, descriptive and analytical. The data is derived from 25 villages and 436 households in the sample of operation. The samples selected based on a formula taking Cochran and far away, nearby villages and the town of Firouzkooch each other.

Based on survey results, the population flows of Firouzkooch Township are rotation, multi-place and episodic. Jobs and climatic factors were dominant in the formation of
